

System Flow — End to End

How a subject becomes a decision: data lands, models train, artifacts ship, the API serves, the dashboard decides — every arrow is a real data path in the repo.

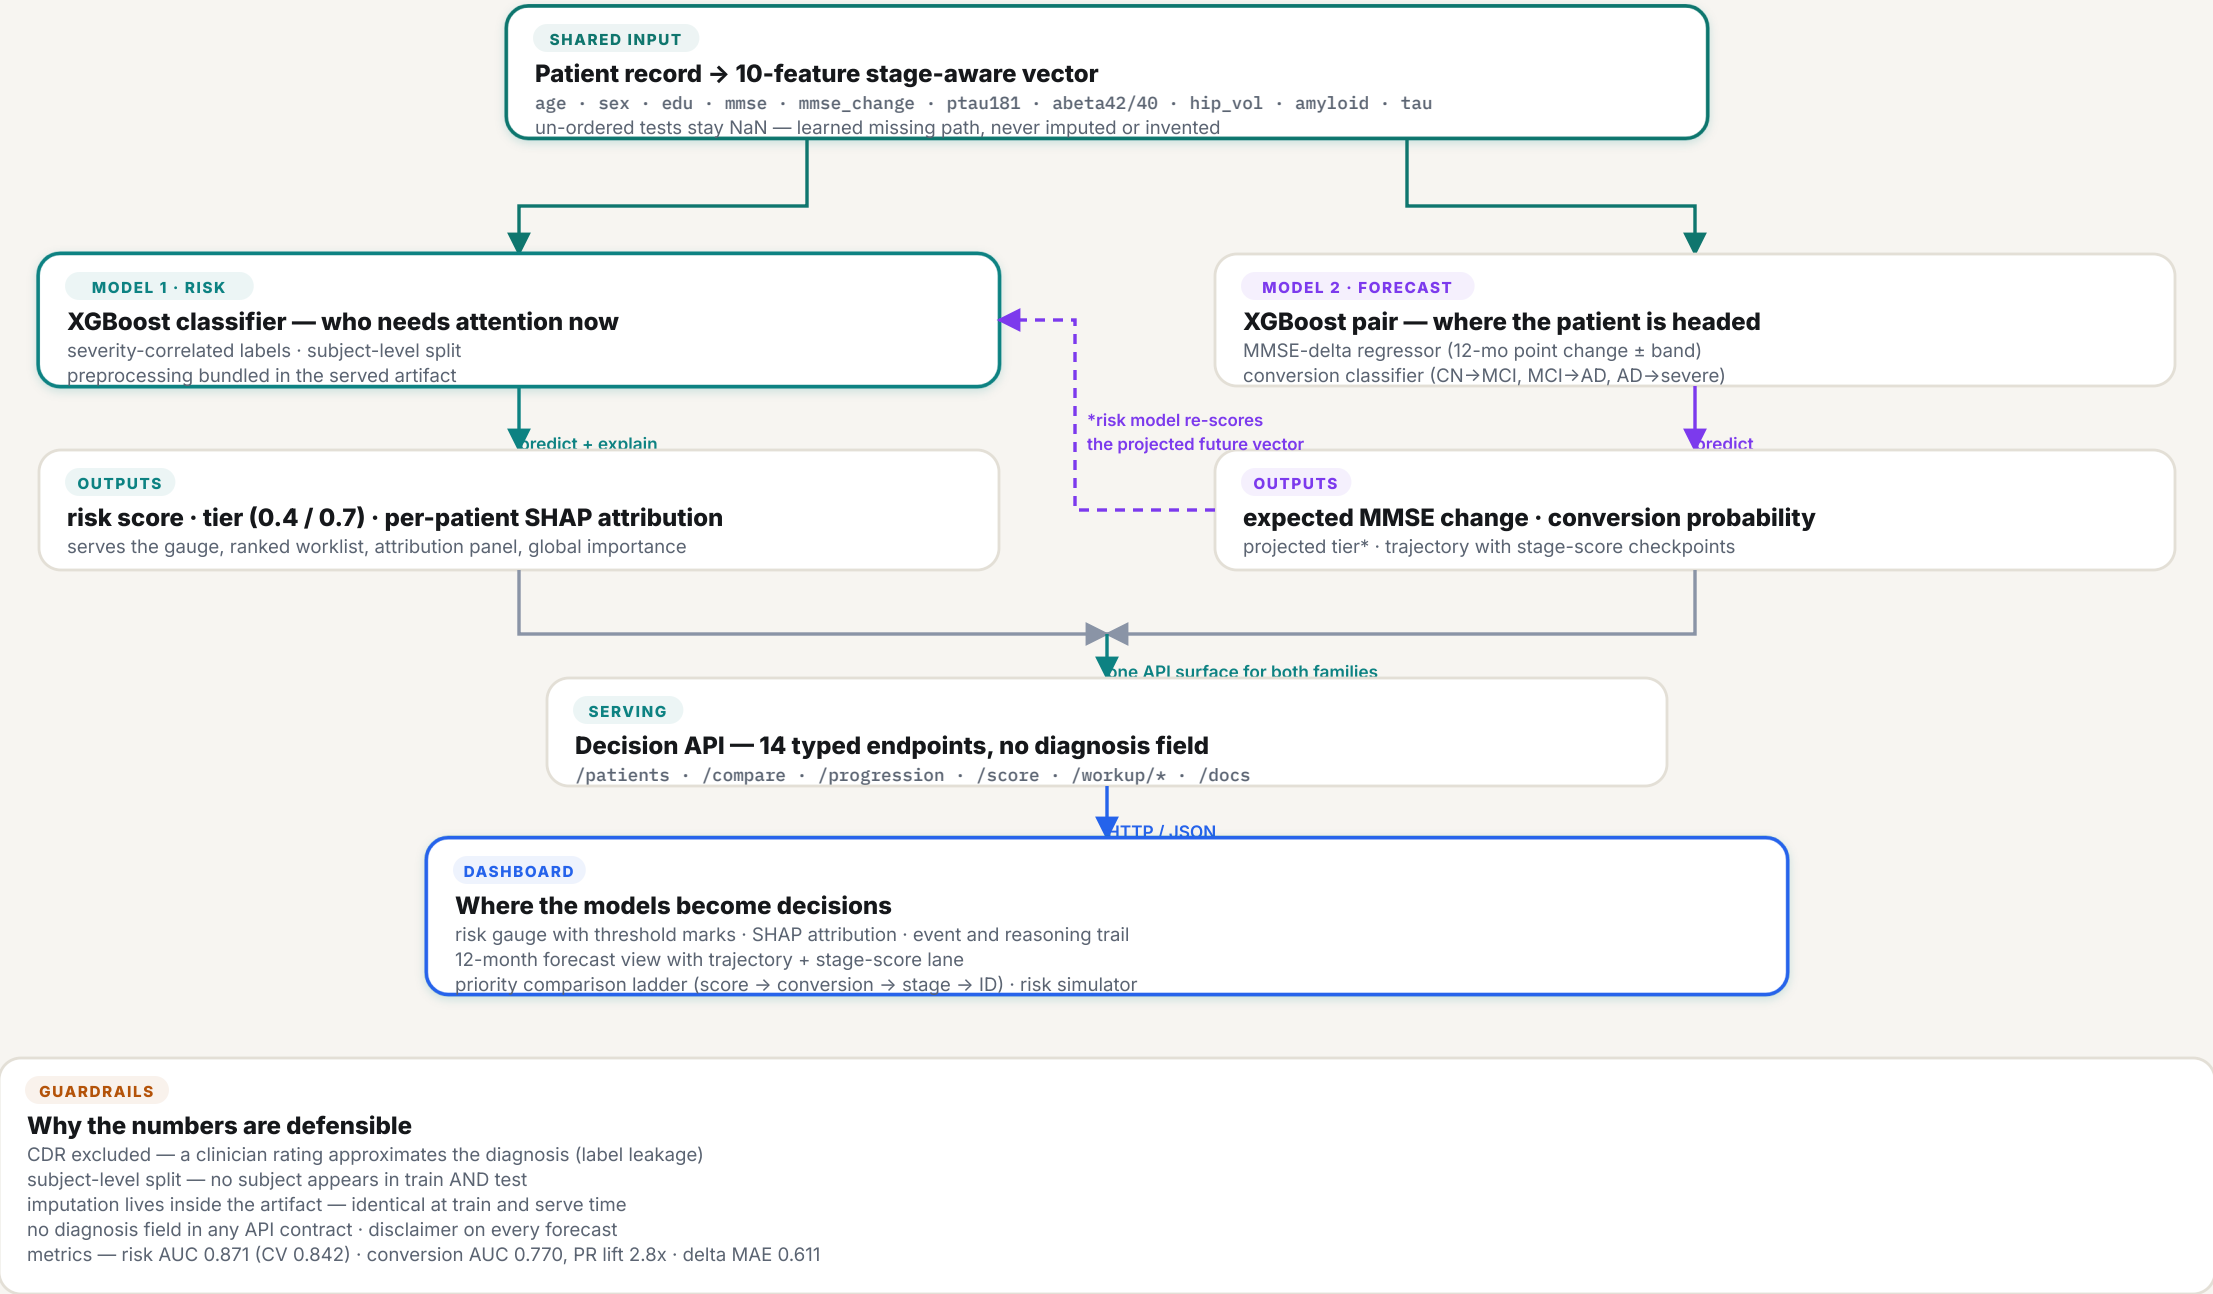

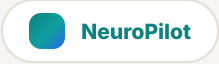

Autonomous Triage — Decision Flowchart

The live loop: the model picks the patient AND the test, every result re-scores the cohort, and two honest exits exist — the engine declines with a reason, or the clinician overrides on the record.

Model Layer — Two Families, One Vector

Both model families read the same stage-aware feature vector; the forecast loops back through the risk model to project the future tier — one consistent model story end to end.

Deployment and Trust — Flow to Production

One push goes from laptop to a Postgres-backed, artifact-complete deployment; every runtime event lands in an append-only trail a judge can inspect.
